# BIOS Setup

## 1.1 Knowing BIOS

The new ASUS UEFI BIOS is a Unified Extensible Interface that complies with UEFI architecture, offering a user-friendly interface that goes beyond the traditional keyboard-only BIOS controls to enable a more flexible and convenient mouse input. You can easily navigate the new UEFI BIOS with the same smoothness as your operating system. The term "BIOS" in this user manual refers to "UEFI BIOS" unless otherwise specified.

BIOS (Basic Input and Output System) stores system hardware settings such as storage device configuration, overclocking settings, advanced power management, and boot device configuration that are needed for system startup in the motherboard CMOS. In normal circumstances, the default BIOS settings apply to most conditions to ensure optimal performance. **DO NOT change the default BIOS settings** except in the following circumstances:

- An error message appears on the screen during the system bootup and requests you to run the BIOS Setup.
- You have installed a new system component that requires further BIOS settings or update.

Inappropriate BIOS settings may result to instability or boot failure. **We strongly recommend that you change the BIOS settings only with the help of a trained service personnel.**

- When downloading or updating the BIOS file, rename it as **SZ390F.CAP** for this motherboard.
- BIOS settings and options may vary due to different BIOS release versions. Please refer to the latest BIOS version for settings and options.

## 1.2 BIOS setup program

Use the BIOS Setup to update the BIOS or configure its parameters. The BIOS screen include navigation keys and brief onscreen help to guide you in using the BIOS Setup program.

### Entering BIOS at startup

To enter BIOS Setup at startup, press <Delete> or <F2> during the Power-On Self Test (POST). If you do not press <Delete> or <F2>, POST continues with its routines.

### Entering BIOS Setup after POST

To enter BIOS Setup after POST:

- Press <Ctrl>+<Alt>+<Delete> simultaneously.
- Press the reset button on the system chassis.
- Press the power button to turn the system off then back on. Do this option only if you failed to enter BIOS Setup using the first two options.

After doing either of the three options, press <Delete> key to enter BIOS.

- The BIOS setup screens shown in this section are for reference purposes only, and may not exactly match what you see on your screen.
- Ensure that a USB mouse is connected to your motherboard if you want to use the mouse to control the BIOS setup program.
- If the system becomes unstable after changing any BIOS setting, load the default settings to ensure system compatibility and stability. Select the **Load Optimized Defaults** item under the **Exit** menu or press hotkey <F5>. See section 1.10 Exit menu for details.
- If the system fails to boot after changing any BIOS setting, try to clear the CMOS and reset the motherboard to the default value. See section 1.1.7 Jumper in your user manual for information on how to erase the RTC RAM via the Clear RTC RAM jumper.
- The BIOS setup program does not support Bluetooth devices.

### AI Overclocking Guide

To establish an overclock via the AI Overclocking utility, please follow these steps:

- Load UEFI defaults by pressing F5, then press F10, and select save and reboot.
- Enter the operating system and run Cinebench or your preferred workload/stress test.
- After the test has been run for the desired time, reboot the system, and then enter UEFI.
- Set the Core Ratio function to "AI Optimized". The motherboard will proceed to adjust the overclocking settings according to the cooler score (in-depth details provided later in the guide).
- Save by pressing F10, and reboot the system.
- Enter the operating system and run your preferred stress test. If the system is stable, no further changes are required. Please note that the CRU frequency applied by the AI Overclocking utility is based upon Prime 95 2.6.6 (non-AVX) stability. This is due to limitations of the AVX Offset parameter and also because CPU overclocking margins are limited when running AVX workloads. However, we recognize some users run software that contain AVX code, so we have included AVX-related CPU voltage and frequency guidelines within the AI Overclocking monitoring pane of UEFI; please refer to the "AVX Vcore" and "Max AVX Stable Frequency" values, and manually set to CPU Vcore and the CRU ratio accordingly. And, if using Adaptive Vcore mode, please check the recommended loadline values within the AI Feature menu and then apply the highest displayed value to the "CPU load-line calibration" setting within the External DIGI+ Power Control section.
- By default, the AI Overclocking feature caters for environmental temperature changes, so it may alter the CPU frequency when you reboot the system. There is no need to make adjustments unless you would like to lock the overclock to a preferred frequency. If you prefer to disable the temperature tracking feature, simply set the Cooler Score setting to "Stop training" within the AI Features menu.

Note: Provided you don't swap/change the processor, any parameter adjustments applied by the AI overclocking feature are due to cooler efficiency score changes.

After following these steps, if you'd like to make manual adjustments, please read the remainder of this guide for a detailed breakdown of each function of AI Overclocking. In fact, it's wise to read the entire guide before you start because it provides valuable insights related to how the utility works.
